| | (1) $R_{\max} = 1.3 \cdot \tilde{R}$ | (2) $R_{\max} = 1$ |
|---|---|---|
| $\beta_{\text{trial}}$ | $[-0.063, -0.072]$ | $[-0.063, -0.081]$ |
| $\beta_{\text{appeals}}$ | $[-0.053, -0.065]$ | $[-0.053, -0.075]$ |

*Note:* This table depicts the bounded estimates for $[\tilde{\beta}, \beta^*]$ in the two sets of regressions. $\tilde{\beta}$ is the coefficient for each conviction variable in the multivariate model with individual controls and party, municipal, and election fixed-effects. $\beta^*$ is the bias-adjusted coefficient for each conviction variable in the same multivariate model using $\delta = 1$ as the degree of selection on unobservables and under $R_{\max}$ values on the top row.
